Supplementary Assembly Instructions for the UK

Read the Assembly Instruction Booklet and these Supplementary Instructions carefully before Installation

These instructions together with those supplied with the appliance cover the basic principles to ensure the satisfactory installation of the boiler.

In all cases the installation must comply with current Building Regulations, Local Authority Byelaws and other specifications or regulations as they affect the installation of the boiler. It should be noted that the Building Regulations requirements can be met by adopting the relevant recommendations given in British Standards BS 8303, BS EN 15287-1:2007 as an alternative means to achieve an equivalent level of performance to that obtained following the guidance given in Approved Document J.

Please note that it is a legal requirement under England and Wales Building Regulations that the installation of the boiler is either carried out under Local Authority Building Control approval or is installed by a Competent Person registered with a Government approved Competent Persons Scheme. HETAS Ltd operate such a scheme and a listing of their Registered Competent Persons can be found on their website at www.hetas.co.uk.

Where "Building Regulations" is quoted this refers to the building regulations for England and Wales. For Scotland and Northern Ireland use the appropriate Building Regulations Part F - (Scotland) and Building Regulations Part L - (Northern Ireland).

Codes of Practice - refer to the most recent version

- BS 7671:2008 Requirements for electrical installations. IEE Wiring Regulations.
- BS 8303 Code of practice for installation of domestic heating and cooking appliances burning solid mineral fuels.
- BS 8423:2002 Fireguards for fires and heating appliances for domestic use.
- BS EN 12828 Heating systems in buildings.
- BS EN 7074 Expansion vessels and ancillary equipment for sealed water systems.
- BS EN 14336 Installation and commissioning of water based heating systems.
- BS EN 5546 Installation of hot water supplies for domestic purposes.
- BS EN 13384 - 1+2:2002 Chimneys - Thermal & fluid dynamic calculation methods - Chimneys serving one appliance.

Health and Safety Precautions - Special care must be taken when installing the boiler such that the requirements of the Health and Safety at Work Act are met.

Note: The addition of anything that may interfere with the normal operation of the appliance without express written permission from the manufacturer or his agent could invalidate the appliance warranty. This could also infringe the HETAS Regulations.

Handling - Adequate facilities must be available for loading, unloading and site handling.

Fire Cement - Some types of fire cement are caustic and should not be allowed to come into contact with skin. In case of contact wash immediately with plenty of water.

Asbestos - This boiler contains no asbestos. If there is a possibility of disturbing any asbestos in the course of installation then please seek specialist guidance and use appropriate protective equipment.

Metal Parts - When installing or servicing this boiler care should be taken to avoid the possibility of personal injury.
**Boiler Performance**

Total thermal output is 12 kW with 3.8 to 10.4 kW available for controlled space heating/domestic hot water production.

The difference of 1.6 kW is accounted for by heat radiated directly into the room, unless the supplied shield is fitted in which case it will reduce this to 1.1 kW and increase the maximum output to 10.9 kW.

This must be taken into account when designing the central heating system and in particular when siting the appliance.

**Preparatory Work and Safety Checks - IMPORTANT WARNING**

This boiler must not be installed into a chimney that serves any other heating appliance.

There must not be an extractor or ceiling/paddle fan fitted in the same room as the boiler as this can effect the safe operation of the appliance.

A Carbon monoxide sensor which complies with BS EN50291-1: 2001 must be fitted in the same room as the appliance and positioned as outlined in the Building Regulations Part J. Either mains or battery powered models may be used.

Consult the HETAS web site – www.hetas.co.uk for suitable models.

Further guidance on the installation of carbon monoxide alarms is available in BS EN 50292:2002 and from the manufacturers’ instructions. Provision of an alarm should not be regarded as a substitute for the correct installation and regular servicing.

**Chimney**

The chimney must be swept at least twice a year, one of which should be during the annual service, preferably at the beginning of the Heating season.

In order for the boiler to perform satisfactorily the chimney height must be sufficient to ensure an adequate draught of approximately -15 Pa so as to clear the products of combustion and prevent smoke emission into the room.

**NOTE:** A chimney height of not less than 4.5 metres measured vertically from the outlet of the boiler to the top of the chimney should be satisfactory.

The outlet from the chimney should be above the roof of the building in accordance with the provisions of Building Regulations Approved Document J.

**Connection to Chimney**

The appliance is supplied with a 125mm flue gas connector that allows connection to either a suitably lined masonry chimney or a prefabricated factory made insulated metal chimney in accordance with the instructions.

It will be necessary to fit an adaptor to the flue gas connector for chimney diameters greater than 125mm. Maximum diameter is 150mm.

Because the boiler operates at high efficiencies, the temperature of the flue gases is at times lower than conventional solid fuel appliances. Although it is not classed as a condensing appliance, the low flue gas temperature results in condensation occurring within the flue. Any chimney flue system must therefore be able to withstand the effects of condensate and operate under wet conditions (designation letter W). In addition it should be soot fire resistant and able to withstand the corrosive effects of flue products generated by solid fuels (Designation G and 3 respectively). If installation is into an existing masonry chimney then it will require re-lining with a liner meeting the specification described above. Existing concrete or clay lined chimneys are NOT suitable for this boiler and must be lined as described above. All installations must be in accordance with Building Regulations Approved Document J. For suitable flue manufactures please refer to the HETAS web site as above.

Any existing chimney must be clear of obstruction and have been swept clean immediately before installation of the lining system. If there is suitable liner already installed ensure any existing draught stabiliser is removed or sealed. If there is any doubt about the liner suitability it should be replaced.

If there is no existing chimney then any new system must be to the designation described above and in accordance with Building Regulations Approved Document J.

**Under no circumstances should a flexible liner designed solely for use with gas fires be used with a solid fuel burning appliance.**

A single wall metal fluepipe is suitable for connecting the boiler to the chimney but is not suitable for use as the complete chimney.

Any bend in the chimney or connecting fluepipe should not exceed 45°. 90° bends should NOT be used.
Combustible material should not be located where the heat dissipating through the walls of fireplaces or flues could ignite it. Therefore when installing the boiler in the presence of combustible materials due account must be taken of the guidance on the separation of combustible material given in Building Regulations Approved Document J. Clearances are also required for servicing around the appliance and to allow for radiation directly in front of the appliance see section 2.5 of the main Assembly Instructions.

Adequate provision (e.g. easily accessible soot door or doors) must be provided for sweeping the chimney and connecting fluepipe.

CO-emissions related to 13% O₂ content at nominal / partial power 48/167 mg/m³.

Hearth
The hearth should be able to accommodate the weight of the boiler, and its chimney if the chimney is not independently supported. The weight of the boiler is indicated in the brochure.

The boiler should be installed on a non-combustible hearth of a size and construction that is in accordance with the provisions of the current Building Regulations Approved Document J.

The clearance distances to combustible material beneath, surrounding or upon the hearth should comply with the guidance on the separation of combustible material given in Building Regulations Approved Document J.

If the boiler is to be installed on a combustible floor surface, it must be covered with a non-combustible material at least 12mm thick, in accordance with Building Regulations Approved Document J to a distance of 30cm in front of the boiler and 15cm to each side measuring from the door of the combustion chamber.

Combustion Air Supply
This is an open flued appliance. The air supply can be provided either directly from outside via an air duct or from the room of installation. In order for the boiler to perform efficiently and safely there must be an adequate air supply into the room in which the boiler is installed to provide combustion air. The provision of air supply to the boiler must be in accordance with current Building Regulations Approved Document J. An opening window is NOT appropriate for this purpose.

Combustion air ventilation requirements for the 12kW Baxi Bioflo: -

<table>
<thead>
<tr>
<th>Air permeability</th>
<th>To outside</th>
<th>Communicating walls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Older properties &gt;5 m³/(h.m²)</td>
<td>38.5 cm</td>
<td>60 cm²</td>
</tr>
<tr>
<td>Newer properties ≤5 m³/(h.m²)</td>
<td>66 cm</td>
<td>100 cm²</td>
</tr>
</tbody>
</table>

Air vents must be fitted lower than 450mm when in vertical walls.

Alternatively the air supply may be provide via an air duct 75mm in diameter and up to 9m in length (reduced 1m in length for every 90° bend used) see section 2.3.4a of the Assembly Instructions.

If an air vent duct is connected to the appliance for the provision of combustion air then a terminal guard /grill must be fitted to prevent vermin etc. from entering the appliance and or blocking the duct. A ball of 13 mm should not be able to pass through the grill.

The installers should provide labels for the ducts and grilles with the following information.

a) Air Inlet Duct Label. “This duct supplies air to a solid fuel appliance and its flueing system. It should not be blocked or restricted under any circumstances. For more information refer to the person responsible for the building; Name and contact details.............”

b) Duct Grille Label. “The duct behind this grille supplies air to a solid fuel appliance and its flueing system. It should not be blocked or restricted under any circumstances. For more information refer to the person responsible for the building; Name and contact details ............”
Connection to the Central Heating System
The appliance is intended for sealed systems only. The specific model imported is delivered with sealed system components inside.
Sealed system components include:

- Expansion Vessel (12L) High Temp.
- Circulating Pump.
- Safety Valve and Pressure Gauge.
- A Filling Loop is not provided as standard (Multifit Filling Loop Kit 248221 is recommended).

The central heating system must be in accordance with

Electrical Connections
The installation of any electrical services during the installation of this boiler and the associated heating system must be carried out by a registered competent electrician and in accordance with the requirements of the latest issue of BS 7671.

- Power cable - 3 core to appliance.
- 4 core cable to wiring centre from appliance ie. L₁, N and E to wiring centre external controls. L₂ switched live back to the appliance - see section 4.7 in Installation Instructions.
- Frost protection must be provided by a system frost stat.

Commissioning and Handover
Ensure all parts are fitted in accordance with the instructions.

On completion of the installation allow a suitable period of time for any fire cement and mortar to dry out before lighting the boiler. Once the boiler is under fire check all seals for soundness and that the boiler and water system are operating correctly. Ensure that the flue is functioning correctly and that all products of combustion are vented safely to atmosphere via the chimney terminal.

On completion of the installation and commissioning ensure that the operating instructions for the boiler are left with the customer. Ensure that the customer is familiar with the correct safe use of the appliance and emphasise that THE BOILER MUST BE OPERATED ONLY WITH THE RECOMMENDED FUEL.
